## 2 Use of the eHealth SSO solution

The complete overview of the profile and a step-by-step implementation to start protecting a new application with SSO @ eHealth is described in the eHealth SSO cookbook.

This section specifies how the call to STS must be done to have access to the web service. You must precise several attributes in the request.

To access the Generic Insurability web services, the response token must contain:

- "true" for all of the boolean certification attributes.
- A value for all the NIHII11 certification attributes

If you obtain:

- obtain "false" for one boolean certification attributes
- do not obtain any value for one of the nihii11 certification attributes

contact eHealth to verify that the requested test cases were correctly configured.

The documents GenIns\_STS\_samlRequest.xml and GenIns\_STS\_samlResponse.xml provide STS request/response examples.

### 2.1 Healthcare professional

The request for the SAML token is secured with the eID1 of the professional. The certificate used by the Holder-Of-Key (HOK) verification mechanism is an eHealth certificate. The needed attributes are the following (AttributeNamespace: "urn:be:fgov:identification-namespace"):

- The social security identification number of the professional:  
*urn:be:fgov:ehealth:1.0:certificateholder:person:ssin* and *urn:be:fgov:person:ssin*

For each professional, the following information must be asserted by eHealth:
